REVA UNIVERSITY

AI/ML in Agriculture

Instructor

- Pandas: Introduction and Series
- DataFrames Manipulation
- Data Analysis and Visualization
- Data Filtering and Selection
- Handling Missing Data
- Data Aggregation and Grouping
- Matplotlib: Basic Plotting
- Advanced Chart Types
- Seaborn: Statistical Visualization
- ML Workflow Introduction
- Supervised vs Unsupervised Learning
- Train-Test Split and Validation
- Cross-Validation Techniques
- Overfitting and Underfitting
- Hyperparameter Tuning
- Scikit-Learn Library Basics
- Linear Regression Concepts
- Regression Model Evaluation
- Logistic Regression
- Decision Trees for Classification
- Feature Importance Analysis

Module 3: AI/ML Applications in Agriculture

Only testing

✅ Correct!

Preparation = cleaning, feature engineering, splitting.

Question 3 of 3

Why evaluate models?

- It's optional
- To measure performance
- To waste time
- For fun

✅ Correct!

Evaluation tells us if the model works well.

Question 3 of 3

CNNs are best for:

- Text only
- Images and spatial data
- Audio only
- Numbers only

✅ **Correct!**

CNNs excel at image and grid-like data.

Only sums

Only multiplication

✅

Correct!

Yes, operations like array1 + array2 happen element-wise automatically.

Scales numbers

Deletes data

Reduces dimensions

✅ Correct!

One-hot creates binary columns for each category.

Question 3 of 3

Why engineer features?

To complicate

To improve model performance

Random

Not needed

✅ Correct!

Good features help models learn better patterns.

✅ Correct!

CV gives better estimate by averaging K runs.

Question 3 of 3

Stratified CV ensures:

- ○ Random split
- ◉ Class proportions maintained
- ○ No split
- ○ Faster training

✅ Correct!

Stratified keeps class distribution in each fold.

- It enhances efficiency and decision-making
- It reduces crop yields

✅ **Correct!**

By leveraging Precision Irrigation Systems, farmers can optimize operations, reduce waste, and improve overall productivity.

Question 3 of 3

When applying Precision Irrigation Systems, what should be the primary focus?

- Understanding irrigation scheduling
- Ignoring improved techniques
- Avoiding technology
- Using outdated methods

✅ **Correct!**

Focusing on irrigation scheduling ensures that the implementation of Precision Irrigation Systems yields the best results.

- It reduces crop yields

✅ Correct!

By leveraging Soil Property Prediction, farmers can optimize operations, reduce waste, and improve overall productivity.

Question 3 of 3

When applying Soil Property Prediction, what should be the primary focus?

- Understanding Nutrient prediction
- Ignoring improved techniques
- Avoiding technology
- Using outdated methods

✅ Correct!

Focusing on Nutrient prediction ensures that the implementation of Soil Property Prediction yields the best results.

- Handle missing values, normalize
- To delete it
- Not needed

✅ **Correct!**

Weather data needs cleaning and feature creation.

Question 3 of 3

Useful weather features:

- Only temperature
- Temp, rainfall, humidity, wind
- None
- Color

✅ **Correct!**

Multiple weather factors affect crop growth.

REVA UNIVERSITY | AI/ML in Agriculture | Instructor

- (●) L2 penalty to prevent overfitting
- ( ) More complexity
- ( ) Noise

✅ **Correct!**

Ridge adds L2 regularization to reduce overfitting.

Question 3 of 3

Lasso can:

- ( ) Only predict
- (●) Perform feature selection via L1
- ( ) Never work
- ( ) Only classify

✅ **Correct!**

Lasso's L1 penalty can shrink coefficients to zero.

- [x] Deep CNN with skip connections
- [ ] Clustering algorithm
- [ ] Decision tree

✅ **Correct!**

ResNet uses residual connections for very deep networks.

Question 3 of 3

Fine-tuning means:

- [ ] Starting from scratch
- [x] Adjusting pre-trained weights
- [ ] Deleting model
- [ ] Only testing

✅ **Correct!**

Fine-tuning retrains later layers on new data.

- You Only Look Once
- Yearly Object Learning
- Yellow Orange Light
- None

❌ Incorrect

Correct: **You Only Look Once**

YOLO is a fast object detection algorithm.

Question 3 of 3

YOLO advantage:

- Slow
- Real-time detection
- Low accuracy
- CPU only

✅ Correct!

YOLO processes entire image in one pass = fast.
